Sage Data Exchange

by **MBA Business Software**

Making the exchange of Sage 100 Data, Simple with Sage Data Exchange. Query your Sage data real-time using XML and JSON with GET and POST.

[Demo Site](#) [Subscribe Now \(\\$2,500.00\)](#)

Sage Data Exchange is an easy way to get data in and out of your [Sage 100](#) system from an external application. Sage Data Exchange was built on the latest version of PxPlus from [PVX Plus Technologies](#), taking advantage of the included XML and JSON tools to GET and POST Sage 100 ERP tables.

Sage Data Exchange Application The application allows users to maintain tables that are not included in Sage 100, like users and product categories. Users are linked to specific customers or vendors in Sage 100 and their access is limited to common information and data specific to that customer or vendor. (For example, they can get a list of products through the API, but cannot get a list of customers.) Administrative User access is unlimited. (For example, administrators can get a list of all customers and all orders for all customers through the API.)

Sage Data Exchange API Developers access Sage 100 data through resources in the API. All resources have a GET (default) method and most have additional methods to LIST or UPDATE data. See the API Resources in the tabs below.
